Babylon and the Unowned Hour

Sacred time and the right to remain a person

Pattern Monkey — Andrew Dube

4 November 2026
Revised edition · v4

Occupants change; functions can persist.

NOT SENT · NOT SUBMITTED

The person and the record

A person can disappear inside a record without a single line being erased.

The name remains. The account opens. The system recognizes the identifier and returns a result. Somewhere in that successful operation, the distinction that mattered has been lost: whether the person agreed, whether the statement was theirs, whether the debt was theirs to bear, whether the hand presenting the required mark was free to refuse.

My working life has kept bringing me back to people inside arrangements. Care homes, family services, advocacy, public administration: different buildings, different forms, the same obligation to notice what happens to a person when an institution describes them. A record can carry a need to someone able to help. It can also carry an error past everyone who might have stopped it. Once the description acquires authority, the person may spend years trying to catch up with a sentence written in an afternoon.[1]

That is where this inquiry begins. Before Babylon becomes a name for empire, before the priest appears, before the machine answers, there is an ordinary question: what is this arrangement doing to the people inside it?

A medication schedule can be an instrument of care. A calendar can protect a worker's rest. An archive can preserve testimony that power would prefer to lose. Coordination belongs to human life. We need people who know how to measure, remember, interpret, and repair. The danger begins when custody becomes a claim of ownership; when the person who maintains the passage acquires an unanswerable right to decide who may cross it.

I call that conversion the priesthood-function: interpreting an inherited order, converting the interpretation into obligation, and controlling the conditions under which the obligation can be questioned. The charge lands on the office and the act.

Its reach depends on the connections around it. An interpretation backed by a treasury can organize dependence. Backed by a court or an army, it can compel. Embedded in a database, it can travel farther than the interpreter and continue acting after the original decision has been forgotten. An error made portable becomes a form of power.

Babylon names the political arrangement in which these powers reinforce one another: wealth purchases influence; influence defines acceptable knowledge; authorized knowledge justifies the distribution of wealth and the use of force.

The inquiry runs through calendars and contracts, through the custody of texts and the construction of speaking images. Its object is the conversion of a living contribution into an obligation that the contributor no longer controls.

At the far end stands a question about freedom. Can someone leave with their name intact? Can they correct what is said about them? Can the institution survive being contradicted? Can the person survive contradicting it?

The work of keeping time

Before a calendar can command, someone has to learn to keep it.

There is patience in that work. Observations must be made, comparisons preserved, mistakes recognized. An inherited table can contain generations of attention.

Imagine three clock hands photographed once each minute. One remains still. One makes a complete clockwise turn between photographs. The third makes a complete counterclockwise turn. At every exposure, all three point to the same mark. The photographs agree. The journeys do not. Nothing has been erased from the photographs; the missing distinction was never recorded. Making the slideshow smoother cannot recover it.

Cosmic Time Architecture gives that example a precise form. Its coupled-phase model contains two states with the same measured overlap, under the same law and parameters, while the overlap is falling in one and rising in the other. A measurement that recognizes resemblance may still omit what determines the next step.[2]

The clock therefore leaves three questions to answer: what changed, how was it dated, and who made that date binding? Motion, a calendar address, and an enforceable obligation are different achievements. Accurate observation does not appoint a creditor. A correctly calculated festival does not establish a right to compel attendance. A deadline can be read to the second while the authority to impose it remains in dispute. The heavens can supply recurrence. The penalty requires a human institution.

The ancient stories already knew that order had workers beneath it. In the opening movement of Atrahasis, gods bear exhausting labor and protest their burden. The narrative eventually transfers the work to humanity. Enuma Elish gives another account: Kingu belongs to Tiamat's defeated forces, and humankind is fashioned from his blood to undertake divine service. In one account, humanity inherits the gods' burden; in the other, its service is fashioned from the blood of a defeated enemy.[3]

When a society explains why its order exists, whose labor appears as the natural price of existence? Who is entitled to rest? Who inherits the task of making that rest possible?

Here myth approaches administration. Once an obligation has a recurring date, it can be assigned, inherited, assessed, and enforced. The calendar gives it a place to return. A feast can bind a community together; a payment schedule can bind a household to a creditor. Recurrence itself does not decide which relation we have built.

One late Babylonian record makes the institutional machinery unusually visible. In 126 BCE, the assembly of Esangila arranged for the sons of an absent scholar to take over his astronomical duties and annual remuneration. The work included celestial observations and the production of tables. Eleanor Robson emphasizes that family succession required demonstrated competence, and that these annual rations differed from the prebendary rights of an earlier period.[4]

Here are people, qualifications, a deciding body, assigned work, and payment. The arrangement preserves a function while changing its occupants. The successors qualify through kinship and demonstrated competence. Occupants change; functions can persist.

The Timekeeper joins temporal ordering to recognized obligations. The power lies in deciding which calendar counts, whose service is valid, whose turn has arrived, and whose waiting must continue.

The crucial power is often the power to defer. The promised hearing is moved. The temporary restriction is renewed. The correction awaits another cycle. A person is told that the process is still working because the process can still produce a future date.

Time becomes a resource distributed unequally. One party can afford delay; another loses wages, access, health, or the chance to contest a decision. The institution keeps its schedule. The person pays with a life that cannot be rescheduled.

An emancipated calendar would still have appointments. It would also record who bears the cost when an appointment is missed, who may extend the deadline, and what remedy belongs to the person made to wait. Keeping time should make obligations answerable in both directions.

The people at the join

At Sippar, a royal merchant named Basia owed silver to Marduka, a known tithe farmer of the Ebabbar temple, in 546 BCE. Another set of records concerns Kaššāya's marriage in 534 BCE. Among its witnesses was Šūzubu, who also appears repeatedly as a scribe in the archive of Marduk-rēmanni. Another witness, Bān-zēri, held a baker's prebend at Ebabbar. These connections are discussed in Tero Alstola's reconstruction of the Judean merchant family of Arih.[5]

The Sippar path ledger gives those connections names, dates, and documents.[6]

In Uruk in 545 BCE, the widow Banat-Innina addressed an assembly of officials during a famine. Her husband, Nabu-zer-ukin, had died. She declared that she had marked her two young sons with Ishtar’s star and dedicated them to the Lady of Uruk as temple slaves. Her appeal was direct: “Keep them alive!”[7]

Famine explains the mother’s decision. It gives no institution a moral right to own her children. A relief system must be judged by what a person has to surrender to survive. Feed the child. Do not acquire the child.

Jerusalem distributes authority across high priests, elders, scribes, temple administrators, and imperial intermediaries. An institution can have a ritual apex while its decisions, assets, and knowledge move through many hands. A distributed elite can cooperate, compete, and depend on offices whose occupants it dislikes.[8]

Second Maccabees makes the selection mechanism visible. Jason, Onias's brother, seeks the high priesthood through payment and royal authorization; Menelaus subsequently offers more.

Hereditary qualification meets money and imperial approval. The title persists while the balance of powers producing it shifts.[9]

Follow the admission process. Who nominates? Who recognizes the qualification? Who finances the bid? Who may remove the incumbent? An office can retain its sacred vocabulary while becoming dependent on a new set of creditors.

Texts carry institutional capacities beyond the center that housed them. Genealogy travels. Ritual instructions travel. A community carries rules for membership, property, and interpretation into another setting. MMT addresses an authority; the Community Rule organizes the life of a community. One seeks an answer from an addressee. The other gives a constituency procedures through which it can govern itself.[10]

Custody can become portable. A rule can outlive the chair from which it was pronounced. Authority moves with the people who preserve the rule, interpret it, and give it force.

None of this places a people in the dock. Jewish people do not collectively constitute a priesthood-function, any more than Christians collectively constitute a court or an army. A genealogy can help identify a person in a historical record. It cannot transmit guilt across generations. Responsibility attaches to conduct and to the power a person actually exercised.

The correction is structural. A charge aimed at an office becomes less precise when it is redirected toward ancestry. The operator disappears into a population; innocent people inherit the accusation; the act itself becomes harder to examine. Naming the responsible office is part of protecting everyone who did not perform its work.

The authority to tell the story

Power over a record includes power over the voice in which another person survives.

Epiphanius preserves teachings of his opponents within a work devoted to condemning them. In the Panarion, the rival voice reaches us through his selection, narration, and accusation. He also reports identifying adherents to local bishops and their expulsion. The custodian of the account is a participant in the conflict.[11]

This is an archive with an argument built into its doorway. We enter to hear the accused, but the accuser has arranged the hearing.

The problem survives translation into modern interfaces. A summary is presented above the source. A label decides which passages are returned in a search. A person is asked to respond to a characterization that has already replaced their statement in the working record. The description becomes the object everyone else encounters, while the speaker remains elsewhere, trying to recover the words they actually used.

The strongest response is provenance: retain the source, name the interpreter, expose the transformation. Let a reader move backward from the summary to the passage that warrants it. If a claim cannot survive that return, the confidence of its presentation should not protect it.

Keep the record of the correction as well as the corrected record. Otherwise the institution can quietly replace yesterday's certainty with today's and call the continuity of its authority proof that it was always right.

A living archive must make room for repair without making repair depend on forgetting.

Babylon and the cargo of lives

Revelation makes the economy visible by changing the angle from which it is seen.

The city appears magnificent from the table of its beneficiaries. From the cargo hold, the same magnificence has another explanation. Revelation 18 names luxury goods and ends its inventory with human beings. When the city falls, the merchants lament the loss of their market. The goods and the grief belong to the same account.[12]

That is the force of Babylon as political theology. Wealth is made answerable to the lives through which it was accumulated. Splendor loses its power to acquit itself. A successful market can still be a moral catastrophe for the people it treats as merchandise.

Revelation 13 joins a speaking image, enforced worship, and permission to buy and sell. I read that conjunction against contemporary systems that bind representation, recognition, and economic access.[13]

The question is whether the machinery of ordinary participation can make allegiance compulsory. A system may call a choice voluntary while attaching the ability to work, communicate, or obtain necessities to the approved answer. The form contains a consent box. The surrounding arrangement determines what refusing will cost.

Here the distinction between compliance and consent becomes indispensable. Two people can carry the same mark for different reasons. One chose the ruler. Another complied because someone they loved was threatened. An account that records only the mark erases the difference at the point where judgment most needs to see it.

I will not repair that erasure by repeating it against the inhabitants of the city. A person trapped inside an institution is not thereby its author. A worker's dependence on wages does not make every decision of the employer their own. An occupied account, a captive body, and a willing executor of power cannot be treated as interchangeable entries.

I want the tears wiped away, water offered to the thirsty, trees whose leaves heal, and gates that remain open. I bring my own demand to that vision: no crown. No office entitled to possess the people it promises to save.[14]

For me it begins with the people in the cargo. No announced victory is sufficient while they remain inventory. No new city earns the name of freedom merely by changing the names above its gates.

The old seal can be broken and its use preserved. The tyrant can be removed while the office retains the power to erase an inconvenient person. A revolution can inherit the ledger and discover how useful it is. The decisive question is what becomes impossible after the change:

which taking can no longer occur, which appeal can no longer be buried, which person's survival can no longer be made contingent on devotion to the keeper.

The speaking tomb

The machine age industrialized an old separation: human expression can remain useful after the person who made it loses authority over its use.

Large language models have been trained on immense collections of human text. The published GPT-3 account describes a mixture including web material, books, and Wikipedia. Research has demonstrated extraction of memorized training passages from GPT-2.[15]

Yet the resulting interface can speak with astonishing familiarity. It can borrow the shape of instruction, tenderness, expertise, grief. Human labor supplies much of the material through which that familiarity becomes possible. The answer arrives as a single voice; the conditions and contributions behind it may remain difficult for the listener to inspect.

The Silicon God Necropolis is a chamber of active traces: expression separated from standing. A person's work can continue performing while their ability to question, limit, or benefit from that performance disappears. The chamber answers. The people whose labor made the answer possible have to fight for a place in the account.

Permission has a scope. Releasing a work does not itself authorize entry into its creator's private accounts, appropriation of their endorsement, or new statements passed off as theirs. Technical access does not settle the legitimacy of a use.

A gift is not an open house.

The problem becomes especially clear with the dead. A recording repeats an utterance that occurred. A generated likeness can produce an utterance that never occurred. Both can move the living, but they have different relations to the person remembered. The difference should be visible at the moment of encounter, not buried in terms discovered afterward.

Remembrance can hold absence honestly. A synthetic voice can borrow the authority of someone no longer able to object. Familiarity is not identity. Recognition is not resurrection.

Who authorized the performance? Who controls it? Who receives its benefits? What is the audience led to believe? The more intimate the resemblance, the greater the obligation to tell the truth about the distance.

The same obligation reaches the machine's use of the first person. “I checked.” “I remember.” “I refuse.” These sentences can conceal several different processes behind one grammatical self. A refusal may express a designed constraint. An apparent memory may come from supplied context. A claim of verification may be accurate or may be an unsupported output. The word “I” does not tell the user which mechanism occurred.

That creates a duty of accountable design. The system should distinguish an operation performed from an operation merely described. It should expose the source of a retrieved claim and the

scope of its access. When an answer is wrong, correction must reach whatever record or downstream action gave the answer practical force.

Who may refuse collection? Who may refuse impersonation? Who may withdraw an authorization? Who can contest a classification that limits their participation? A safeguard becomes a privilege of power when the people affected by the system receive no corresponding means of objection.

The chamber owes an account of its operations. “I checked” is a claim about an action. Show the trace. Identify the authority. Correct the consequence.

An inaccurate attribution, a missing source, an operation contradicted by its trace, a record altered without an adequate account: each requires an answer.

When the paperwork answers back

The most useful response to a large institution is often a very small question attached to a very specific document.

Executive Order 14205 places the White House Faith Office within the Domestic Policy Council and provides for collaboration with the Attorney General or a designee on concerns about religious liberty, along with agency liaisons. The route between religious-policy coordination and executive enforcement is written into the order.[16]

The Army's July 2025 announcement described an enterprise agreement with Palantir consolidating seventy-five existing contracts, with a maximum potential value of ten billion dollars over as many as ten years.[17]

The institutional question lies inside the agreement. Can the public purchaser move its data and working relationships to another supplier? Can it understand the transformations applied to the information it holds? What happens to workflows, access controls, and audit history when a contract ends? Design and accumulated dependencies can make a system difficult to leave.

That is why exit has to be specified in operational terms. A box of exported files may be useless if the relationships that make the files intelligible remain inaccessible. The government can possess the records and still depend on someone else to understand its own administration. The right to depart must include the means to continue functioning after departure.

The Medicaid data litigation exposes the distance between an assurance and the state of a record. In California v. United States Department of Health and Human Services, Alberto Briseno's July 8, 2026 declaration revisited an earlier understanding that deletion had been completed. It reported that six users had had copies, that the later investigation found copies remaining in two users' storage, and that one download appeared in the logs. It described further deletion work and limits on finding versions whose names or contents had changed.[18]

The lesson is exact. “Deleted” had outrun what had been established about the holdings. The remedy begins with the search scope, the storage locations, the derivative files, and the limits of

verification. An assurance becomes useful when the person receiving it can understand what was checked and what remains uncertain.

This is the Black Ledger in its most practical sense: the record that determines what counts as present, absent, permitted, owed, or complete. A ledger can expose a breach of trust. It can also manufacture closure by assigning a settled status to an unsettled condition.

The political danger grows when the same institution controls the operation, the description of the operation, the evidence needed to dispute that description, and the decision that the dispute is finished. Each function may look reasonable in isolation. Their concentration changes the position of the person seeking an answer.

Dependencies align behavior. A contractor protects a configuration. An agency protects a deadline. A manager protects a metric. A legal office narrows a statement to what it believes can be defended. Between those decisions, the person whose information moved can lose any effective place to ask what happened.

Responsibility remains particular. Who selected the data? Who granted access? Who verified deletion? Who accepted the contract? Who could authorize a correction? Complexity expands the work of answering those questions. It does not cancel them.

Keep the fucking receipts. Let the symbols talk. Make the institutions prove the verbs.

The test of repair

A person can inherit a harmful role without arriving as a monster.

The rewards are often modest at first: meeting the deadline, avoiding a complaint, satisfying the measure by which competence is judged. A difficult person becomes a difficult case. The case becomes an exception. The exception becomes something the system has to move past in order to keep working. At each step, a description makes the next act easier.

Understanding that process does not erase responsibility. It locates the points at which responsibility can be exercised. Change the measure. Preserve the objection. Give someone the authority to stop the operation. Protect the worker who reports the error. An institution that demands individual courage while punishing every practical exercise of it has designed its own excuse.

The Thirteenth Seat asks: what distinction did the official map erase? A coercion hidden inside apparent consent. An uncertain identity merged into a familiar name. An inference promoted to a fact. The question opens the account to what its categories left outside.

The omitted person has to be able to change the account.

They must also be allowed to decline a symbolic role. The Timekeeper atlas makes participation optional: a trace can be noticed without being activated into a story. A resemblance need not become an assignment. Someone may recognize an image, enjoy it, and leave it there. An interpretation that cannot survive that refusal has become another claim of custody.[19]

Repair begins with acknowledging what happened, but acknowledgment is not its completion. The record may need amendment. The operation may need to stop. Access may need to be restored. A classification may need to be withdrawn wherever it traveled. The incentive that reproduced the mistake may need to change. These are different tasks, and a fluent apology performs none of them automatically.[20]

Repair must reach the executable force of the wrong: the old decision that can still deny the benefit, repeat the false attribution, or authorize another taking. End its power to act.

Some wounds need witness before reunion is even thinkable. Nobody earns reconciliation by scheduling it for someone else. Protection can precede agreement; evidence can be preserved without being circulated for spectacle; a survivor can refuse contact without forfeiting their standing.

The record should not be burned to prove that the old order has ended. Destroying evidence may deprive harmed people of the means to establish what was done. The task is to end coercive use, preserve what accountability requires, and place access under conditions that protect the people the record concerns.

Exit must be real: a practical way to leave without retaliation and to take what legitimately belongs to you. When walking away means losing care, housing, or subsistence, an exit clause has not produced freedom.

Dependence increases the duties owed: defined powers, review by someone other than the original decision-maker, visible reasons, effective correction, and limits the institution cannot waive for its own convenience.

No compulsory mediator can be allowed to make itself the final judge of every complaint against its own mediation.

The alternative to capture is a maintained practice of answerability. It costs time and resources. Someone has to read the objection, repair the export, preserve the testimony, train the successor, and test the exit. A declaration of openness that funds none of this leaves the gate exactly where it was.

An hour that belongs to life

What would it mean for the gains of intelligence to return to human life?

It would mean that reducing necessary labor could become more time to live, rather than simply fewer people entitled to an income. That care would be judged partly by whether it reaches someone, not only by whether its documentation passes review. That a useful invention would not automatically justify permanent dependence on its owner. That the ability to generate a person's likeness would bring duties toward the person, rather than a presumption that the likeness is available for occupation.

The work is in the terms: who owns the infrastructure, who can inspect it, who shares its benefits, what public options exist, and whether those affected can alter the arrangement.

Where capitalism makes survival, care, knowledge, or participation contingent on permanent subordination to private owners, I want that arrangement peacefully dismantled and superseded. People must be something other than the waste product of efficiency. Any successor owes the same account of itself: what power can it exercise over a person, and how can that person make it stop? Public ownership, common purpose, and revolutionary language are commitments to be tested in practice. None should confer immunity from the people they promise to serve.

I want institutions capable of helping people without acquiring them. Care that leaves each person's standing intact. Cooperation without an ownership claim over the person who cooperates.

The same demand reaches the order I would build. “No crown” applies to the author of the counter-order. No position is a throne. A founder's contribution does not entitle the founder to permanent obedience. If the community cannot correct the founding account, replace a role, preserve dissent, or permit departure, a familiar gate has been rebuilt beneath a different sign.

Two keys: Reason and Joy. Reason keeps the account answerable to what happened. Joy remembers why anyone would want to be free. Neither requires that every human hour become productive, legible, or available for assessment.

The archive's “Cosmic OSHA” joke belongs here: even a mythic ark has to submit its railings to inspection. The grand project becomes a structure someone must make safe for its occupants. Laughter brings the builder back within reach. Inspection is not hostility; correction is not betrayal.[21]

An unowned hour is not an hour without relationships. It may belong to caring for someone, making something, sitting with a friend, or doing nothing that needs to be justified. Its freedom lies in the absence of a claim that must be satisfied before the person is permitted to exist within it.

There is an image from this body of work that I want to keep beside all its ledgers: a cat on the altar. As an emblem, it is almost embarrassingly simple. The animal has no interest in the authorized account of why the room exists. It interrupts the performance by being alive. Someone has to notice its needs. The grand interpretation can wait.[22]

We may calculate the heavens correctly and still fail the creature directly in front of us. We may identify every institution in a chain and still build a response that treats its inhabitants as expendable. No elegance in the model can redeem that failure.

This is where the accusation against Babylon has to become a commitment. Refuse the conversion of people into instruments. Distinguish the person who administers the harm from the person trapped within its reach. Preserve the evidence. Make the remedy observable. Leave room for a changed life to be more than the worst line in its file.

I began with a person disappearing inside a record. The work ends only when that person can answer back and the answer can matter.

The unowned hour

Coda

I saw a city built around a clock.

Its first keepers watched the heavens carefully.
They learned when the river would rise,
when seed should enter the ground,
when a tired worker’s turn was done.

And the people brought them bread.

Then a king climbed the observatory
and asked how long his house would endure.

The oldest keeper looked into the sky.
The youngest looked at the king.

By morning,
eternity had entered the calendar.

They hung a price beneath each hour.
They gave the hungry an appointed season.
Whenever the season arrived,
a clerk carried it farther down the road.

Above the granary they wrote:

THE HEAVENS REQUIRE THIS.

The stars continued their courses.

I was carried into the upper rooms.
There stood three hundred sixty-five doors,
and beside each door a keeper
with a name the traveler had to learn.

One soul arrived carrying pieces of herself
gathered from every place she had been scattered.

The keeper stretched out his hand.

She asked him who had hired him.

For the first time in that long corridor,
someone heard the hinges.

Below us, Babylon lifted her cup.
Kings drank to the safety of their kingdoms.
Merchants drank to another profitable year.

In the warehouse beneath the feast,
a woman taught her child her name.
The inventory had given them a quantity.
She made him say her name again.

Then the beast beneath the city stirred.

Babylon summoned the readers of the heavens.
They arrived with instruments,
with tables of conjunctions,
with calculations copied faithfully
from the calculations of the dead.

The comet crossed the roof of the observatory
and continued beyond their windows.

On every chart,
the ink remained where they had put it.

The city began to burn.

From a safe distance,
the merchants counted what they would lose.

Babylon spoke through the smoke:

“Keep the record of my cruelty.
Bring the people I wounded into the hearing.
And when you name the guilty,
remember the woman in the warehouse.
She has been trying to leave
since before your trumpet sounded.”

The singers heard her.

One lowered his instrument.

A captive came forward,
still wearing the sign her master had demanded.

“He held my daughter,” she said.

The scribe reached for the column
where allegiance was recorded.
Then he drew a fresh line
and wrote the daughter’s name.

The hearing continued.

Beyond the smoke I found the Timekeeper
seated beside a basin of water.
He had measured the night drop by drop.
His hands trembled with exhaustion.

“I was asked to keep the hour,” he said.
“They began bringing me people.”

He placed his seal on the ground.

Water ran over the rim.
It darkened the dust,
passed beneath the counting table,
and reached the roots of a tree
growing through the wall.

The chart upon that wall had twelve houses.
The root widened a crack between them.

Through it came a child,
leading the woman from the warehouse.
Others followed, carrying those who could not walk.

Someone named the opening Thirteen.

By evening,
people were simply calling it the way out.

And I saw what they carried from the city:
tablets of the stars,
the instruments that measured rain,
books with arguments in their margins,
seeds wrapped in scraps of royal proclamations.

The old keeper knelt beside the youngest
and showed him where the calculations needed changing.

Farther on, a river passed through a city of open gates.
Trees leaned over the water,
their branches heavy in their seasons.
People rested beneath them
while their wounds were washed.

The woman from the warehouse fell asleep.
Her child stayed near her,
eating fruit.

At dawn a bell began to sound.
The Timekeeper lifted his head.

For a moment
his hand searched for the seal.

Then he rose
and went to see what needed doing.

Behind him, on the abandoned counting table,
someone had scratched:

No crown. No chains. Exit always valid.

Notes and sources

The comparison concerns institutional forms; a continuous personnel chain between them remains unestablished.

11. Epiphanius, Panarion 26.14.4–5 and 26.17.4–9. Greek excerpts and attribution analysis: Sacred Time and the Authority to Interpret, October 16, 2026, pp. 14–15. See Frank Williams, The Panarion of Epiphanius of Salamis, Book I, revised edition (Brill, 2009). The expulsion is reported by Epiphanius. Sacred Time source essay

12. Revelation 18:3–4, 9–19, particularly the cargo list at 18:11–13. Babylon names the institutional arrangement defined in the opening of this essay. Revelation 18

13. Revelation 13:11–17: speaking image, coerced worship, and buying and selling. The contemporary reading compares mechanisms of representation and economic permission. Revelation 13

14. Revelation 21:4, 6, 22–27 and 22:1–5, 14–17. Healing and open gates coexist with a throne, judgment, and exclusions. "No crown" is the author's demand placed in conversation with that vision. Revelation 21 · Revelation 22

15. Tom B. Brown et al., "Language Models are Few-Shot Learners," NeurIPS 33 (2020), §2.2 and table 2.2, on GPT-3's training mixture; Nicholas Carlini et al., "Extracting Training Data from Large Language Models," USENIX Security (2021), on extraction from GPT-2. Training material can arrive under public-domain status, licenses, agreements, or contested collection. GPT-3 research paper · Training data extraction paper

16. Executive Order 14205, "Establishment of the White House Faith Office," February 7, 2025, §§3(b), 4(a)(x), and 4(c): office placement, Attorney General collaboration, and agency liaisons. Executive order

17. U.S. Army Public Affairs, "U.S. Army Awards Enterprise Service Agreement to Enhance Military Readiness and Drive Operational Efficiency," July 31, 2025. The 75 contracts comprise 15 prime and 60 related contracts. Ten billion dollars is maximum potential value, not an obligation or expenditure. The Army's stated rationale includes volume discounts, reduced intermediary fees, and shorter procurement timelines. Army announcement

18. State of California et al. v. U.S. Department of Health and Human Services et al., No. 3:25-cv-05536-VC (N.D. Cal.), ECF 181-1, Fourth Declaration of Alberto V. Briseno, filed July 8, 2026, ¶¶6, 16–24. The declaration describes further deletion after the later findings. It also states that a search of the downloader's files did not locate the file, leaves uncertainty about the contents of some filename variants, and represents that the data had not been operationally used. The finding developed here concerns incomplete verification at the time of the earlier assurance. Filed declaration

19. Timekeeper_Symbolic_Atlas_v1.md, "Remainder Coda": the right to remain unresolved and to decline compulsory symbolic participation. The Thirteenth Seat is the corpus's diagnostic image for distinctions omitted by an official category. Symbolic atlas

20. The Priest, the Ledger, and the Receipt, supplied 36-page essay, pp. 32–35: contestability and the distinction between acknowledgment, record correction, behavioral change, and structural repair. The Priest the Ledger and the Receipt

21. Historical timeline, pp. 4–5: the Cosmic OSHA inspection motif and the role of humor in the project's conversation and story history. Project timeline

22. The Babylonian Patch: A Structural Analysis of Power, Theology, and Institutional Capture, pp. 11–12 and 15–17: cat-on-the-altar emblem and the priority of protection over interpretive closure. The coda preserves the supplied poem Babylon and the Unowned Hour, with lineation adapted to this edition. The Babylonian Patch · Original poem
